TL; DR

Final-year Ph.D. candidate in Scientific Computing with expertise in federated learning, uncertainty quantification, and multi-modal language models. Seeking to apply advanced machine learning research and development skills to solve complex challenges in an AI Researcher or Data Scientist role.

EDUCATION

Uppsala University <i>Ph.D. in Scientific Computing</i>	Uppsala, Sweden 09.2021 – 05.2026 (<i>Expected</i>)
Uppsala University <i>M.Sc. in Computational Science</i>	Uppsala, Sweden 09.2019 – 08.2021
University of Science and Technology of China <i>M.Sc. in Chemometrics, with Honors</i> <i>B.Sc. in Chemistry</i>	Hefei, China 09.2016 – 06.2019 09.2012 – 06.2016

WORK EXPERIENCE

Doctoral researcher <i>Scientific Machine Learning Laboratory</i>	09.2021 – Present Uppsala, Sweden
<ul style="list-style-type: none">Designed and implemented novel algorithms for fair federated learning and uncertainty quantification in large-scale vision-language models, leading to multiple publications.Pioneered methods for modelling aleatoric and epistemic uncertainty in multi-modal AI using probabilistic and generative approaches (e.g., hyperspheric probabilistic modeling, Riemannian Flow Matching).Contributed to research on attack/defence mechanisms in distributed ML and on hierarchical information management systems.Instructed graduate courses in <i>Data Engineering</i> and <i>Cloud Computing</i> and supervised three M.Sc. projects.	
Master thesis student <i>Integrative Scalable Computing Laboratory</i>	02.2021 – 08.2021 Uppsala, Sweden
<ul style="list-style-type: none">Designed and implemented a proactive Kubernetes autoscaler using predictive modeling, reducing average workload response time by 15% in heterogeneous edge computing environments.	
Junior data scientist (Part-time) <i>Scaleout Systems AB</i>	06.2020 – 03.2021 Uppsala, Sweden
<ul style="list-style-type: none">Integrated PyTorch support into FEDn, a production-grade open-source federated learning framework, enhancing its core functionality and user adoption.Developed proof-of-concept applications in computer vision to demonstrate framework capabilities to potential clients.	

SKILLS & TOOLS

Modeling: Uncertainty quantification, generative AI, multi-modal language models, federated learning, probabilistic modeling, Bayesian inference, self-supervised learning.

Frameworks: PyTorch, JAX, pthread, OpenMP, MPI, CUDA, Apache Pulsar.

Cloud & DevOps: Docker, Apptainer, Kubernetes, OpenStack.

Languages: Python, C/C++, Haskell, Erlang, Lisp/Racket.

MAIN PROJECT EXPERIENCE

Accelerating fair federated learning

- Analyzed the suboptimal convergence rates of first-order methods in existing federated learning formulations. Reformulated fairness-aware FL as a dynamic multi-objective optimization problem to achieve provably faster convergence while upholding fairness constraints.
- Proposed **AdaFedAdam**, an algorithm with adaptive hyperparameter tuning and normalized updates, providing theoretical guarantees for accelerated convergence and reduced fairness bias.
- Empirically validated the method's Pareto optimality and robustness across standard FL benchmarks under various data and system heterogeneity scenarios.

Aleatoric uncertainty quantification for vision language models

- Investigated the limitations of post-hoc uncertainty quantification methods for pre-trained vision-language models.
- Proposed and empirically validated a hypothesis on the structural asymmetry of uncertainty between vision and language modalities.
- Developed a novel framework to model aleatoric uncertainty in unit hyperspherical space, systematically evaluated against other state-of-the-art methods.
- Demonstrated enhanced model reliability on downstream tasks, including zero-shot classification and image retrieval, by integrating quantified uncertainty.

Epistemic uncertainty quantification for vision language models

- Investigated the limitations of existing uncertainty quantification methods for pre-trained vision-language models and identified the need for improved epistemic uncertainty modeling.
- Proposed a generative framework using Riemannian flow matching to explicitly model epistemic uncertainty in VLMs.
- Validated the approach through extensive experiments on standard VLM benchmark datasets and demonstrated significant improvements in model robustness and reliability, particularly for out-of-distribution detection.

AWARDS & LEADERSHIP

- **1st Place** in Huawei Sweden Hackathon (2025): Developed a neural operator for SVD approximation, outperforming 78 teams from across Europe.
- **2nd Place** in Huawei Sweden Hackathon (2024): Solved a wireless localization problem using channel charting, competing against over 30 European teams.
- **President** of Society for Industrial and Applied Mathematics (SIAM), Uppsala University Chapter (2024 – Present). Organized seminars and workshops on numerical analysis and scientific computing.
